

Echoliths

Multiple Colors

Echoliths come in many vibrant colors, while there is no difference in function or status between variations.

Their coloration is purely natural and highly diverse, often ranging across bright reefs-like hues that reflect the environments they inhabit. These striking patterns make them visually distinct individuals, even within the same population, without influencing behavior, ability, or social standing.

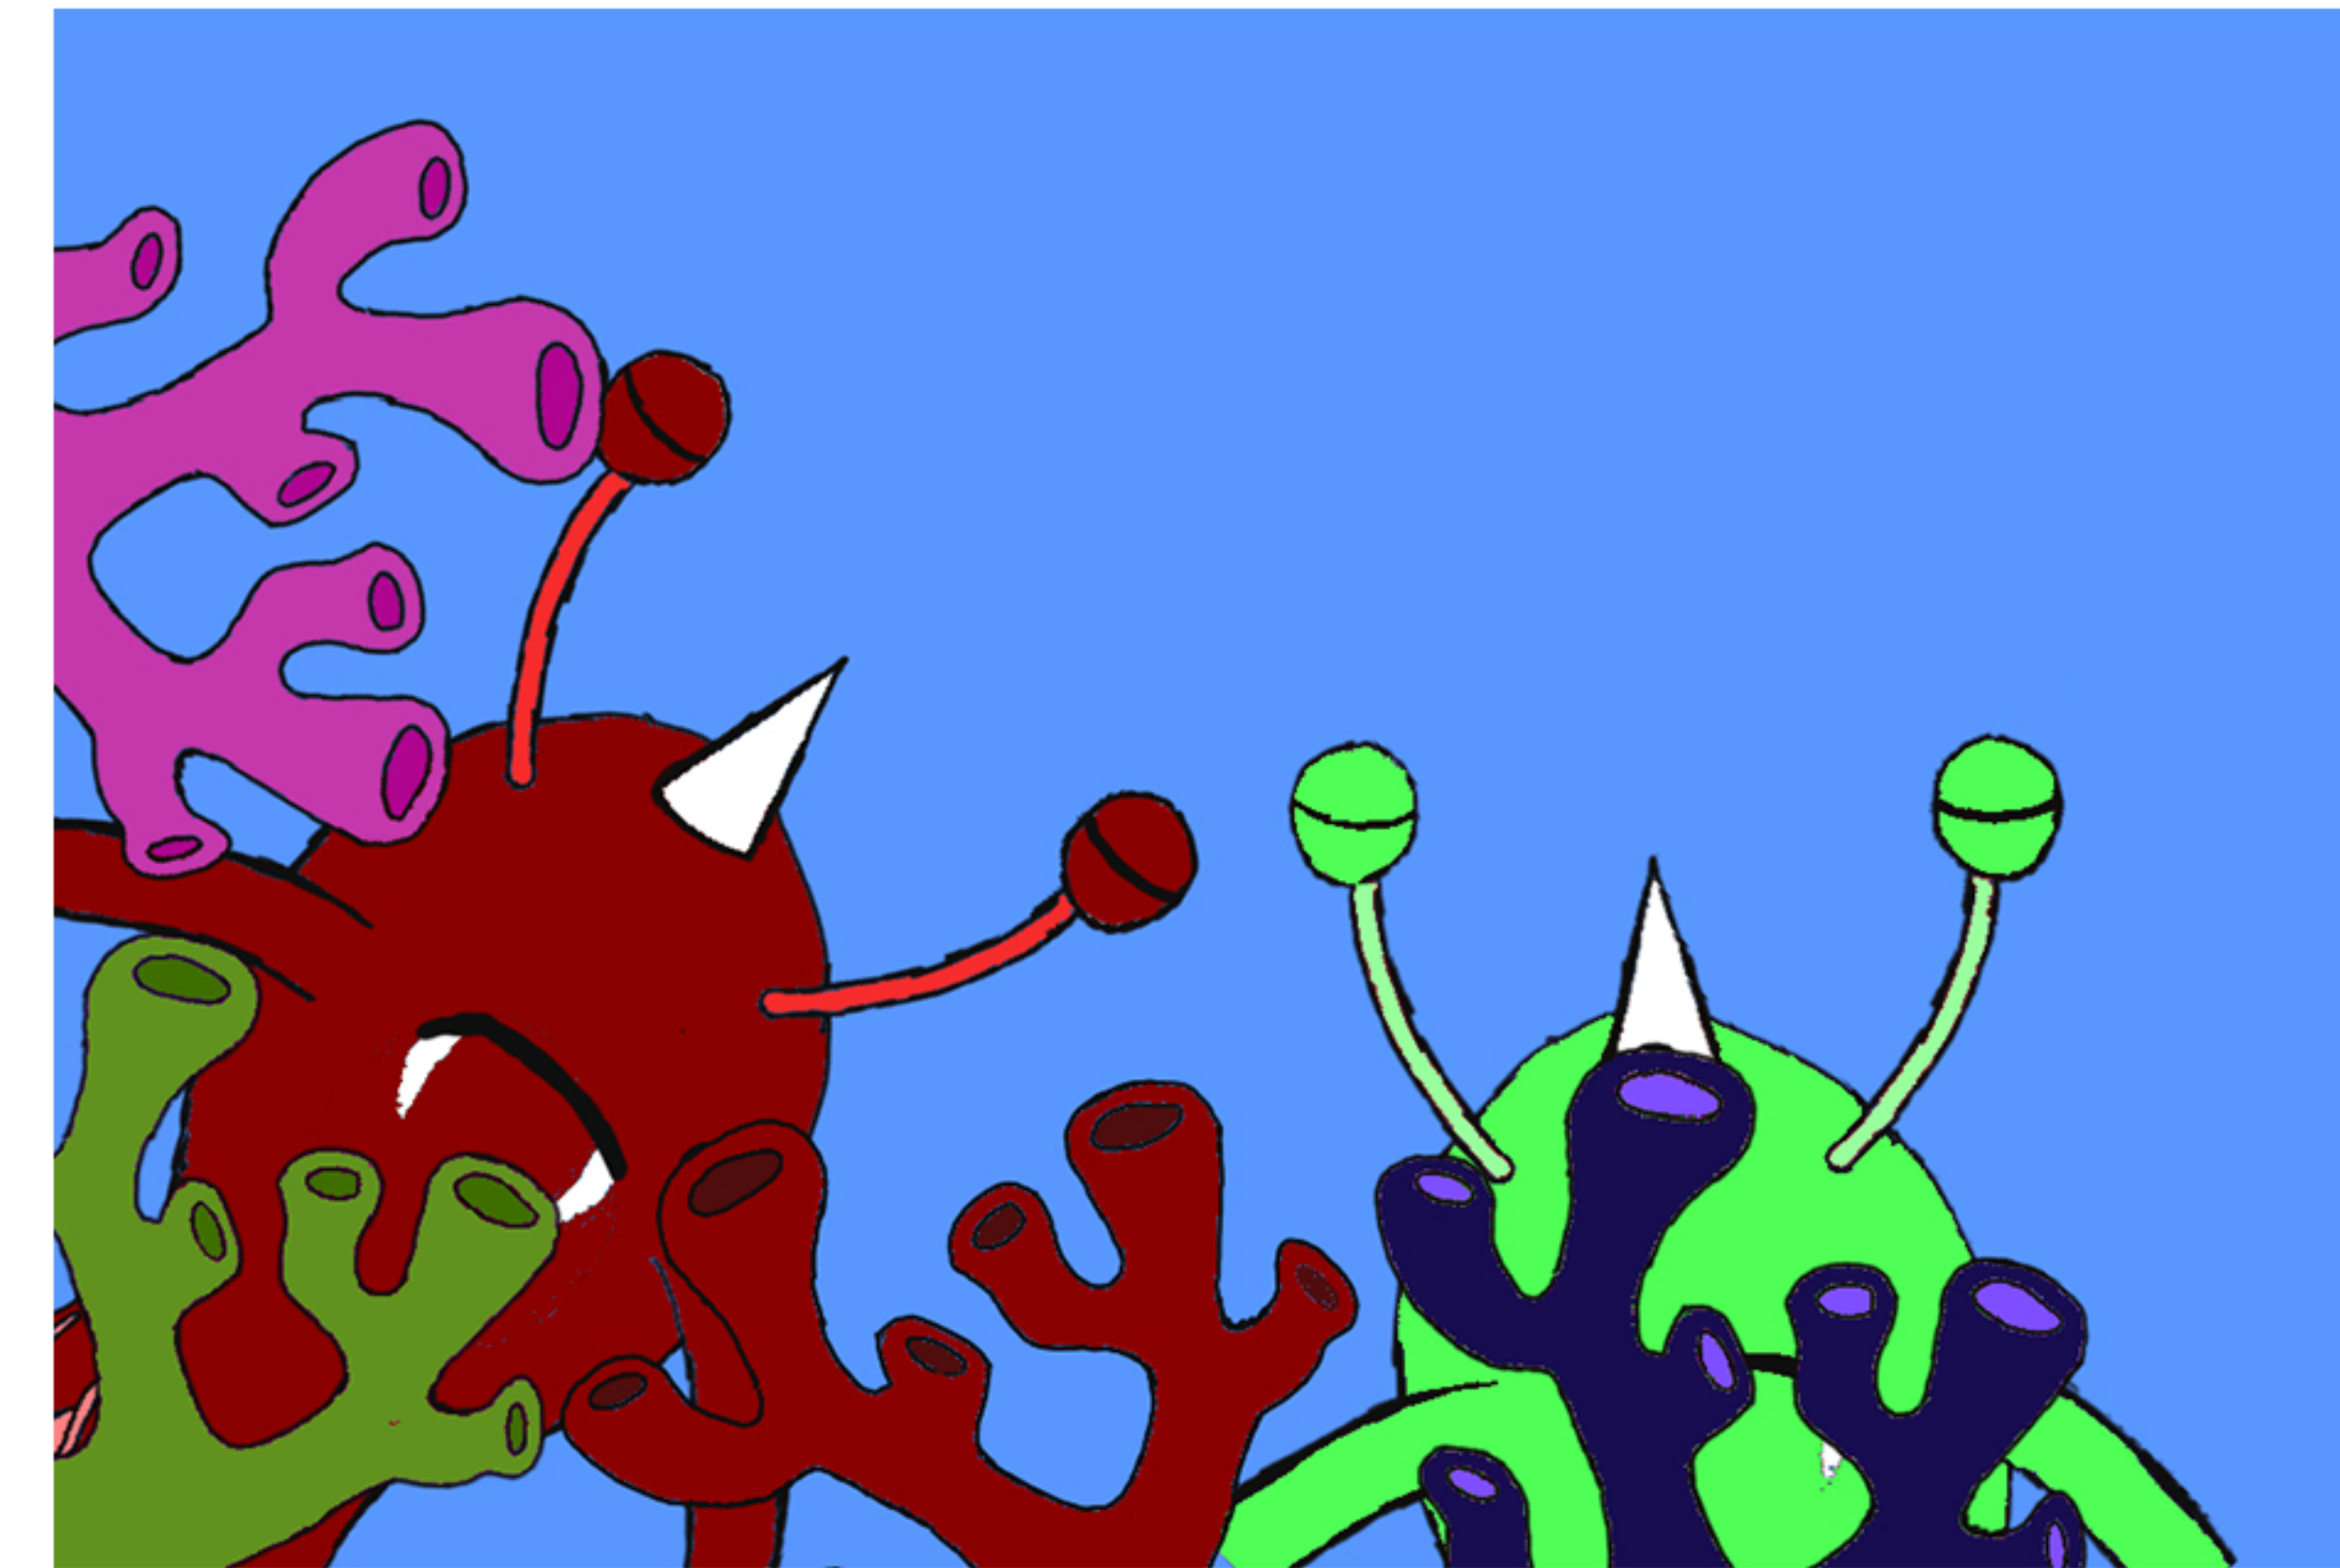

Mainly Aquatic

Echoliths spend most of their time underwater.. However they are capable of spending a full day above water and they tend to do so when they hunt

Sleep Habits

Echoliths tend to sleep near coral reefs, as they are the only common naturally occurring structure That can hid their multicolored bodies. Their eyes are partially active while sleeping allowing them to sense danger and flee if neccesary

Musical Ambush

When hunting above land, Echoliths dangle themselves from a high place stretch thier bodies downward revealing several resonaant channels, They use these channels to mimic sounds of other wildlife and when they attrac prey they drop from above
